USER'S GUIDE TO
Sales & Marketing Management's
Survey OF Buying Power FORECASTING SERVICE

A practical illustration of how the data can be used for planning:

- **sales territory delineation**
- **sales quota assignments**
- **product development**
- **product introduction**
- **customized Buying Power Indexes**
- **advertising media expenditure**
- **long-range corporate development**

About the Data

The tables and statistical material that appear in this User's Guide are based upon data that have appeared in the *Survey of Buying Power Forecasting Service*. The numbers will change from year to year, and there may be some minor modifications in the presentation of the data. However, we believe you'll find this User's Guide a handy introduction to the complete *Service*, and very helpful in illustrating the *Service's* many uses for sales and marketing planning.

How To Use
S&MM's Survey of Buying Power
FORECASTING SERVICE

To be a marketer, to be a sales manager, is to be a planner. One's success or failure often depends upon "making the numbers." That means, first, determining what those numbers should be and, then, developing a plan to reach those targets. Sales and marketing people must plan, therefore, and so must financial managers, retailers, even entrepreneurs.

To help all of these planners, Sales & Marketing Management publishes the **Survey of Buying Power Forecasting Service,** now in its second edition. This year's **Forecasting Service** has data for 1978 and forecasts for 1980, 1981, 1985, and 1990, so it's valuable for short-, mid-, and long-range planning. Indeed, we're certain that the data in **Forecasting Service** provide the most comprehensive look at the markets of the future to be found anywhere.

For each of more than 3,000 U.S. counties, and for all the metro areas in the U.S., data are presented for population, income, and retail sales. The data may be used for both *cross sectional* and *time series* applications. Cross sectional applications may be thought of as being "horizontal," covering the entire U.S., or a smaller area, for a particular year. Time series applications are "vertical," tracing a geographical area over a period of years.

Our forecasts have been made with certain underlying assumptions, employing a "population component" procedure. Independent estimates of births, deaths, and migrations are generated, then either added or subtracted from the appropriate benchmark. Fertility rates, for example, have been projected at their current rate of change. We also estimate that the rate of new household formations will continue unabated.

Our economic forecasts are all presented in current dollars. We are assuming, however, an average inflation factor of 8.5% a year and a real economic growth rate of 3.3% per year through 1992.

To show how the data in **Forecasting Service** may be applied to help make better marketing plans, we would like to take you through an example. The companies and individuals mentioned are hypothetical, and the data may not correspond exactly to figures in **Forecasting Service.** We hope that going over this exercise will give you some idea of the many creative uses of marketing forecasts.

An Example

It is late 1979. John Howard is sales manager of Yankee Leisure Industries, a fledgling company based in Worcester, Mass. The company has a new product, SoundAround, an auto tape deck that may be removed easily and used while jogging, walking, and so on. Its portability helps to prevent theft, because it can be removed from a car and kept in a house.

SoundAround is in test market in the Worcester-Fitchburg-Leominster metro area during 1979. The company plans to sell the product throughout New England in 1980, and to attain national distribution by 1985. It's up to Howard to develop sales and marketing plans. From the test market, he has learned:

- SoundAround's sales in the Worcester test market will be approximately $50,000 a year (at the dealer level).
- Most sales are made to men, 18-34 years old. From those findings, he can begin to develop plans, thanks to help from **Forecasting Service** data.

His first task is to develop a sales organization. He sees in Section 1 the projected data for the six New England states:

TABLE 1

In Section 2 he finds the projected rankings for U.S. metro markets, by population. There are 15 SMSAs in New England:

TABLE 2

Metro Area	*Projected 1980 Population (Thous.)*	*U.S. Rank*
Boston-Lowell-Brockton-Lawrence-Haverhill, Mass.	3,961.4	6

Pittsfield, Mass.	145.1	206
Burlington, Vt.	118.2	243
Lewiston-Auburn, Me.	95.9	273
	10,495.5	

Those 15 markets will have 10,495,500 people, 83.5% of the region's 12,570,300 people. So Howard decides it will make sense to concentrate on those areas.

The Boston area, with nearly a third of the population of the entire New England area, obviously is of paramount importance. Too important, in fact, to be handled by one salesperson. Therefore, Howard looks at the Massachusetts map in the Data Maps section.

From these maps, he decides to split the Boston territory in three parts. The South Boston man will have Norfolk and Plymouth counties plus the adjacent New Bedford-Fall River metro area. The North Boston salesperson will cover metro Manchester-Nashua, in New Hampshire, and Rockingham (N.H.) and Essex counties, in metro Boston. Suffolk County, where the city of Boston is, and populous Middlesex County will be covered by a third salesperson, in a Central Boston territory.

Doing the same with the other New England Data Maps, Howard decides to combine two one-county metros in Connecticut, Bridgeport-Stamford-Norwalk-Danbury and New Haven-West Haven-Waterbury-Meriden, into one sales territory. The three-country Hartford metro area, New England's second most populous, is a separate territory and the adjacent New London-Norwich (Conn.) and Providence-Warwick-Pawtucket (R.I.) metro areas become another territory. In western Massachusetts, three metro areas (Worcester-Fitchburg-Leominster, Springfield-Chicopee-Holyoke, and Pittsfield) are to be combined in a single territory.

Thus, seven salespeople can cover 11 of New England's 15 metro areas, including the 10 largest. In all, the territories comprise 78.7% of New England. The remaining four small metro areas are in Maine and Vermont. Howard decides it would not pay to have a company salesperson travel throughout those states, so he hires a manufacturer's rep to cover Maine, Vermont, and non-metro New Hampshire, on a straight commission basis. The few non-metro counties in the other three New England states will likely "spill over" into the adjoining sales territories, but the volume is so small (4.8% of New England's population), that he decides not to worry about them.

Therefore, here's how the territories will be aligned:

TABLE 3

Territory Number	*Areas*	*Projected 1980 population*
1	Bridgeport-New Haven	1,602,500
2	Hartford	1,075,600
3	Providence-New London	1,111,100
4	South Boston	1,525,700
5	Central Boston	2,112,500
6	North Boston	1,067,100
7	Worcester-Springfield-Pittsfield	1,402,300
8	Manufacturers' Rep	2,074,100
		11,970,900

Howard next has to derive sales goals for the entire territory, and for each sales territory. In Section 2, he learns that the projected population of metro Worcester in 1980 is 656,400.

TABLE 4

And as we've already seen, the population of New England will be 12,570,300. Therefore, the Worcester metro area accounts for 5.2% of New England's population. Howard could multiply $50,000 (estimated annual sales of SoundAround) by 19.23, get $961,500, and call that his target for New England sales in 1980.

It's the number of young males, however, not the total population, which will determine SoundAround sales.

In Section 4, he finds forecasts for each metro area, and each county, by age and by sex. Here, for example, are the Bridgeport data:

TABLE 5

POPULATION BY AGE AND SEX

ESTIMATES METRO AREA	Dec 31 Of Year	 Sex	Population By Sex	Population by Age and Sex 0-5 Years	6-11 Years	12-17 Years	18-24 Years	25-34 Years	35-44 Years	45-54 Years	55-64 Years	65 & Over	Median Age By Sex

He adds the forecasts for males in the 18-24 and the 25-34 columns, and compiles the following table:

TABLE 6

Territory	*Projected number of males, 18-34, in 1980*	*% of Total*
1	220,379	12.48%
2	162,598	9.21

Now Howard has a complete population forecast for his sales territories, focusing on his prime customers. However, he knows there are two other key elements to forecasting sales, besides population: income and retail sales. In Section 3, he gets 1980 projections for Effective Buying Income (EBI) and retail sales. Here, for example, are those data for Bridgeport:

TABLE 7

POPULATION, EFFECTIVE BUYING INCOME, RETAIL SALES, AND BUYING POWER INDEX [BPI]

ESTIMATES METRO AREA County	Year	Dec. 31 Population (Thousands)	% Of U.S.	% Change From 1978	Dec. 31 Households (Thousands)	EBI ($000)	% Of U.S.	% Change From 1978 (Inflation Removed)	Average Household EBI ($)	Retail Sales ($000)	% Of U.S.	% Change From 1978 (Inflation Removed)	Per Household Retail Sales ($)	Buying Power Index (BPI)	Quality Index (QI)

Taking the EBI and retail sales figures, he compiles this table:

TABLE 8

Territory	*Projected EBI ($000) for 1980*	*Projected Retail Sales ($000) for 1980*	*EBI % of Total*	*Retail Sales % of Total*
1	$15,346,302	$7,040,579	16.18%	13.81%

	$94,814,447	$50,951,618	100%	100%

Howard now can construct a customized Buying Power Index, or BPI. His experience in Worcester has indicated that income levels are not as important as the level of retail sales activity or the numbers of young males. Accordingly, he assigns a weight of 2 to his population component, 2 to his retail sales component, and 1 to his EBI component. Then he compiles this table:

TABLE 9

Territory	*(1) Young Males %*	*(2) (x) 2*	*(3) Retail Sales %*	*(4) (x) 2*	*(5) E.B.I. %*	*(6) Component Total (2 + 4 + 5)*	*(7) B.P.I. (Component Total ÷ 5)*
1.	12.48	24.96	13.81	27.62	16.18	68.76	13.75
2.	9.21	18.42	8.88	17.76	9.37	45.55	9.11
3.	8.68	17.36	9.10	18.20	9.16	44.72	8.94
4.	12.17	24.34	12.90	25.80	13.04	63.18	12.63
5.	17.49	34.98	16.86	33.72	17.43	86.13	17.22
6.	11.63	23.26	9.97	19.94	8.94	52.14	10.42
7.	11.40	22.80	11.14	22.28	11.02	56.10	11.22
8.	16.91	33.82	17.28	34.56	14.81	83.19	16.63

From the **Handbook** data, Howard calculates that metro Worcester's buying power, for SoundAround, is equivalent to 5.39% of the buying power for all of his sales territories. If Worcester's potential is $50,000 for 1980, then all the territories should produce a total of $927,644. Here's the way Howard sets his targets for 1980:

TABLE 10

Territory	*1980 sales goal*
1	$127,000
2	84,000
3	83,000
4	117,000
5	159,000
6	97,000
7	104,000
8	154,000
	$925,000

Another key component of the 1980 plan is the allocation of the ad budget. Yankee Leisure has decided it can reach its young male audience most efficiently through TV. Because the product is not yet national, spot TV will be the prime medium. From Section 5, he sees that there are 8 TV markets, or Areas of Dominant Influence (ADIs), in New England.

TABLE 11

TV Market (ADI)	*Projected 1980 Pop. (Thous.)*	*U.S. Rank*
Boston	5,323.8	5
Hartford-New Haven	1,983.9	21
Providence	1,658.8	31
Portland-Poland Spring	789.8	78
Springfield	659.4	84
Burlington-Plattsburgh	638.9	89
Bangor	340.0	145
Presque Isle	98.4	197
	11,493.0	

From Section 7, he gets the data on age and sex for those ADIs. From Section 6, Howard gets ADI data on EBI and retail sales.

Taking the data for all New England ADIs, he can compile an ADI Buying Power Index, similar to the one above.

There are two problems, however. The Bridgeport and the Pittsfield metro areas are in the New York City and Albany TV markets respectively. It would not pay to advertise on those stations, because Yankee Leisure would be paying to reach TV viewers who could not buy its SoundAround. Indeed, only a small percentage of ad dollars would go to reaching New England viewers. Therefore, Howard includes those metro areas in his calculations, but decides to advertise in other media (newspapers, cable TV) to reach those markets.

Howard's concerns are obviously of the present and near future. For sales and marketing vice president Tom Brown, to whom Howard reports, 1985 seems to be almost upon him. Brown is responsible for plotting the company's growth for the next five years. What can Brown learn from **Forecasting Service**?

Brown can begin by evaluating the prospects for his company's home market, between now and 1985. In Section I, he can trace the forecasts for New England and for the individual states:

Looking particularly at the Buying Power Index and the Quality Index, Brown sees that New England's fortunes are expected to decline between 1980 and 1985, compared to the rest of the U.S. New Hampshire and Rhode Island are expected to show gains, it's true, but Connecticut and Massachusetts, the two most populous states in New England, are forecast to show the steepest declines. Brown decides he must look elsewhere, then, for growth markets.

The metro market rankings in Section II will lead him to the growth markets of the early 1980s. In population, for example, the top 40 markets will remain the same in 1980 and 1985, but there will be some internal changes, as some areas move up and others move down.

Of the five top 40 markets that are forecast to move up two or more notches, two are in southern California: Anaheim (17 to 15), and Riverside (26 to 24). A third is in nearby Phoenix (27 to 25). Brown also notes that San Diego is expected to move up from 20 to 19 and that Los Angeles, the nation's second largest market, is expected to grow faster than New York or Chicago. He thinks his company would do well to look into the possibility of opening a regional sales office, or perhaps establishing a plant, in southern California.

The other two fast-growing major markets are Houston and Ft. Lauderdale. Brown finds another table in Section II, one that lists the fastest-growing metro areas between 1978 and 1985.

Of the top 34, 12 are in Florida and 6 are in Texas. Houston and Ft. Lauderdale, therefore, suggest themselves as areas in which Yankee Leisure should establish a base by 1985.

Besides Florida, Texas, and California, are there any other areas to which Brown can look for growth by 1985? Section II also has rankings for Average Household EBI in both 1980 and 1985.

Looking at the top 10 metro areas, he sees that four will be in Michigan. Ann Arbor (3) and Detroit (8) are expected to maintain their positions, while Saginaw (10 to 4) and Flint (11 to 7) are predicted to register strong gains. Brown, therefore, decides to investigate Michigan as a possible base of operations in the Midwest.

He turns to Section III of **Forecasting Service**, where he can find detailed information on the state's metro areas. (See Table 16)

Detroit, the largest market, does not look too promising, at least at first. The metro area is expected to suffer population losses throughout the decade. But the Quality Index is expected to increase, telling Brown that income there will rise faster than the U.S. average and that shoppers will be attracted from beyond the metro area. Furthermore, the Quality Index will be highest in suburban Oakland County, which is expected to enjoy growth in population, income, and retail sales. Brown thinks that Oakland County, Michigan, looks like an excellent regional sales base for SoundAround, especially because it offers the potential of selling SoundAround as a factory-installed option to the area's automakers.

The key number: the 4% decline of males in the 18-24 age bracket. There will be growth in the 25-34 age group, but the numbers definitely show an aging of SoundAround's prime buyers by 1985. It's not too early, Brown concludes, to start developing products for more mature buyers, to be on sale by 1985.

Just as Brown can look at 1985 with **Forecasting Service**, so can he and Yankee Leisure's other top executives look to 1990. The decision whether or not to build a plant could depend on growth market data that reach to 1990. Long-range product development should take into account the fact that the 35-44 age group will be the fastest-growing, with a projected increase of 39% between 1980 and 1990. (See Table 17) By incorporating such data into their plans, sales and marketing executives can help their companies keep up with, and anticipate such changes, and make a few "fastest-growing" lists of their own.

Explanation of Terms Used in The S&MM FORECASTING SERVICE

AVERAGE HOUSEHOLD EFFECTIVE BUYING INCOME. Total Effective Buying Income (EBI) divided by the number of households. This measure is often used as an indicator of market quality. However, care should be taken in its use particularly in areas where there is a disproportionate share of college, military, and institutional population housed in group quarters. Since total EBI includes such income, a per-household measure can credit households with income not properly theirs.

BUYING POWER INDEX (BPI). A weighted index that converts three basic elements—population, Effective Buying Income, and retail sales—into a measurement of a market's ability to buy, and expresses it as a percentage of the U.S. potential. It is calculated by giving weights of .5 to the market's percent of U.S. Effective Buying Income, .3 to its percent of U.S. retail sales and .2 to its percent of U.S. population and adding together the results. The BPI is probably one of the Survey of Buying Power's most widely used single market measures. Because it is broadly based, it is most useful in estimating the potential for mass products sold at popular prices. The further a product is removed from the mass market, the greater is the need for a BPI modified by more discriminating factors—income class, age, sex, etc.

CONSOLIDATED METROPOLITAN AREA. A large metropolitan complex comprising a metropolitan area of a million people or more, together with other contiguous metropolitan areas, the population of each of which is at least 75% urban and which meet certain minimum criteria of integration with the central metropolitan area.

The composition of the Consolidated Metro Areas is as follows—**Chicago-Gary-Kenosha:** Chicago, Gary-Hammond-East Chicago, Kenosha. **Cincinnati-Hamilton:** Cincinnati, Hamilton-Middletown. **Cleveland-Akron-Lorain:** Cleveland, Akron, Lorain-Elyria. **Dayton-Springfield:** Dayton, Springfield (Ohio). **Detroit-Ann Arbor:** Detroit, Ann Arbor. **Houston-Galveston:** Houston, Galveston-Texas City. **Indianapolis-Anderson:** Indianapolis, Anderson. **Los Angeles-Long Beach-Anaheim:** Los Angeles-Long Beach, Anaheim-Santa Ana-Garden Grove, Oxnard-Simi Valley-Ventura, Riverside-San Bernardino-Ontario. **Miami-Fort Lauderdale:** Miami, Fort Lauderdale-Hollywood. **Milwaukee-Racine:** Milwaukee, Racine. **New York-Newark-Jersey City-Bridgeport:** New York, Bridgeport-Stamford-Norwalk-Danbury, Jersey City, Long Branch-Asbury Park, Nassau-Suffolk, Newark (N.J.), New Brunswick-Perth Amboy-Sayreville, Patterson-Clifton-Passaic. **Philadelphia-Wilmington-Trenton:** Philadelphia, Trenton, Wilmington (Del.). **San Francisco-Oakland-San Jose:** San Francisco-Oakland, San Jose, Santa Rosa, Vallejo-Fairfield-Napa. **Seattle-Tacoma:** Seattle-Everett, Tacoma.

COUNTY. The primary political administrative subdivision of a state, the county is widely used for marketing purposes for the following reasons: (1) The range of current available data below the state level is greatest at the county level. (2) Geographic boundaries are rarely altered. (3) Complete national coverage is achieved by adding all counties. (4) Sales & Marketing Management's 3,135 county units are manageable building blocks for alignment of sales territories. (5) County boundaries are readily identifiable.

For Louisiana, parishes are used in lieu of counties, while Alaska is tabulated by the census divisions delineated by the Census Bureau as county equivalents. The District of Columbia is treated as a single county unit. In Virginia, all cities are by law independent of counties; hence, the S&MM Forecasting Service treats them as county units in themselves. The cities of Baltimore, Md., St. Louis, Mo., and Carson City, Nev., are also independent cities. The 1981 edition of the Forecasting Service follows the county boundaries as defined by the 1980 Census of Population. Therefore, compared to the previous editions, certain revisions were made: 1. Columbus, Georgia is no longer coextensive with Muscogee county. 2. Alaska went from 29 to 23 Census Areas or Boroughs. 3. Jacksonville, Florida is no longer coextensive with Duval County. 4. Nashville-Davidson, Tennessee is no longer coextensive with Davidson county.

EFFECTIVE BUYING INCOME (EBI). A classification exclusively developed by Sales & Marketing Management, it is personal income less personal tax and nontax payments. Personal income is the aggregate of wages and salaries, other labor income (such as employer contributions to private pension funds), proprietors' income, rental income (which includes imputed rental income of owner-occupants of nonfarm dwellings), dividends paid by corporations, personal interest income from all sources, and transfer payments (such as pensions and welfare assistance). Deducted from this total are personal taxes (federal, state, and local), nontax payments (such as fines, fees, penalties), and personal contributions for social insurance. The resultant figure is commonly known as "disposable personal income". S&MM removes from this figure compensation paid to military and diplomatic personnel stationed overseas to arrive at Effective Buying Income.

Effective Buying Income is a bulk measure of marketing potential. It indicates the general ability to buy and is essential in comparing, selecting, and grouping markets on that basis.

The forecasts of EBI include not only anticipated real economic growth but also a continuation of inflation.

HOUSEHOLD. A household consists of all the people occupying a single housing unit under 1980 census rules—such as a house, an apartment, a group of rooms, or a single room. The members of a household need not be related, and a single person living alone in a housing unit is also counted as a household.

All persons who are not members of households are regarded as living in group quarters: institutions, college dormitories, military barracks, etc. Although a county's population total will include all the people in the area, the household total will not do so because it excludes those living in group quarters. For these forecasts, we are assuming the current rates of new household formations will continue.

INDEPENDENT CITIES. Several cities in the U.S. that do not fall within official county boundaries are treated as independent entities by the Census Bureau. The *Forecasting Service* lists those independent cities as county entities. Except for St. Louis, Mo., Baltimore, Md., and Carson City, Nev., which replaced Ormsby County, all independent cities are in the state of Virginia. These are Alexandria, Bedford, Bristol, Buena Vista, Charlottesville, Chesapeake, Clifton Forge, Colonial Heights, Covington, Danville, Emporia, Fairfax, Falls

Church, Franklin, Fredericksburg, Galax, Hampton, Harrisonburg, Hopewell, Lexington, Lynchburg, Manassas, Manassas Park, Martinsville, Newport News, Norfolk, Norton, Petersburg, Poquoson, Portsmouth, Radford, Richmond, Roanoke, Salem, South Boston, Staunton, Suffolk, Virginia Beach, Waynesboro, Williamsburg, and Winchester.

MEDIAN AGE. A calculation that divides the age distribution of the population into two equal groups, with one-half of the population younger, and one-half older, than the median figure. The median age is not necessarily the level where the population is most concentrated. Median ages are helpful in comparing the relative youth or age of counties' respective populations.

METROPOLITAN AREA. (See Standard Metropolitan Statistical Area.)

NEW ENGLAND COUNTY METROPOLITAN AREA (NECMA). The U.S. Office of Federal Statistical Policy and Standards defines these areas (intentionally not designated as "standard" metro areas) by applying to the New England counties the same criteria used in establishing Standard Metropolitan Statistical Areas (SMSAs) outside New England. While they are not as satisfactory as the New England SMSAs in fulfilling the metropolitan concept (owing to the unique geographic characteristics of the region), they are more convenient for marketers who work with county units and are better suited to the development of demographic estimates. The name of each NECMA is composed of the names of the SMSA central cities that it contains.

PER HOUSEHOLD RETAIL SALES. Total retail sales divided by the number of households. Care should be taken in the use of this measure since retail sales are recorded by the location of the establishment, not by the purchaser's place of residence. (A bias occurs also in counties with large group quarters populations since they do not live in households.)

PERCENT CHANGE FROM 1980 [of population]. Covers the period from December 31, 1980 to December 31 of the forecasted year.

PERCENT CHANGE FROM 1980 (INFLATION REMOVED) [of EBI or retail sales]. For each of the monetary forecasts, an estimate in constant (1980) dollars has also been derived. The percent change of this estimate from that for 1980 is shown here to indicate the forecast real growth.

PERCENT OF U.S. A market's share of the total U.S. population, households, Effective Buying Incime, or retail sales.

POPULATION. Updated from the 1980 U.S. Census of Population and Housing, it is an estimate of the number of people living in an area at the end of the year. It includes people living in colleges and hospitals, and armed forces permanently assigned to the area, but excludes tourists and transients. Large changes in group-quarters populations are not projected in these forecasts.

POPULATION BY AGE AND SEX. Male and female population estimates for nine age groups are useful for marketers who seek to aim their products or services at specific sales targets. For example, the 12- to 17-year-old population is a target of those marketing soft drinks and phonograph records. Several of the age groups are also associated with lifestyle stages—such as the preschoolers (0-5 years), teen-agers (12-17 years), and young adults (18-24 years)—which are used in the formulation of marketing strategy.

QUALITY INDEX (QI). Shows the extent to which the market's "quality" is above or below par (represented by 100). The market's percent of the national population (which can be taken to represent par) is divided into the Buying Power Index, yielding the Quality Index. A high index could reflect either above-average buying power or a strong influx of shoppers from outside the area, or both.

RETAIL SALES. All net sales (minus refunds and allowances for returns) of establishments engaged primarily in retail trade. Retail sales by such nonretailers as wholesalers and service establishments are not counted.

Although retail sales are frequently used to gauge the purchasing power of the residents in a market, they are only an approximation because the market's volume may be affected by the movement of shoppers to and from adjacent areas. They are actually a measure of the drawing power of local-retail establishments.

The 1977 Census of Retail Trade excludes two items which were included in the 1972 sales statistics.

1. Sales (or other) taxes collected from customers and forwarded to taxing authorities.
2. Carrying charges or other charges for credit.

The forecasts of Retail Sales include not only anticipated real economic growth but also a continuation of inflation at a slowly declining rate.

STANDARD METROPOLITAN STATISTICAL AREA (SMSA). Revised criteria by the U.S. Office of Federal Statistical Policy and Standards provide that an SMSA must include either (1) one city with a population of at least 50,000; or (2) one city with a population of at least 25,000, which, when combined with contiguous places having a density of 1,000 or more people per square mile, will have a polulation of at least 50,000 (provided that the city and contiguous places are in a county or counties with a population of at least 75,000).

A contiguous county is included in an SMSA if at least 75% of the resident labor force is nonagricultural, and at least 30% of the resident employed workers work in the area. A contiguous county that does not satisfy those requirements will be included if at least 75% of the resident labor force is nonagricultural and if it meets at least two criteria of metropolitan character and one criterion of metropolitan integration. Minimum criteria of character: (1) 25% of population is urban; (2) population gain of 15% between two most recent decennial censuses; and (3) density of 50 persons per square mile. Minimum criteria of integration: (1) 15% of resident employed workers work in the area; (2) 15% of the county's employed workers live in the area; and (3) sum of workers commuting to and from the central county or counties is equal to 20% of the employed workers living in the county.

SMSAs are defined by the government along county lines except in New England, where towns and cities are the units of definition. The federal government's alternative, but unofficial, New England County Metropolitan Areas, comprised of whole counties rather than cities and towns, are used by Sales & Marketing Management for those states. All metropolitan areas in the *Forecasting Service* SMSAs, the realigned New England areas—are commonly referred to as Sales & Marketing Management Metropolitan Areas.

Thirty-five new Metropolitan areas have been designated by the OFSPS based upon the 1980 Census and new criteria. These criteria will be applied in re-evaluating all SMSAs when the necessary 1980 Census data become available. Due to limitations in the previous criteria, potential metropolitan areas had been developed for the Survey of Buying Power. The new set of areas combined with the original ones now properly represents metropolitan United States. Under the new criteria Rapid City SMAS, Iowa was dropped.

TELEVISION MARKET. The *Forecasting Service's* TV markets are the ARBITRON's Areas of Dominant Influence (ADIs). ARBITRON studies each county for its measurable viewing patterns. The hours of viewing accorded each TV station whose signal reaches the county are totalled; then each station's percentage share of total viewing hours is calculated. The market of origin of the TV stations with the largest share of viewing hours becomes the ADI name of that market, and all counties whose largest viewing share is given to stations of that same market of origin are grouped within the ADI. (For its purposes, ARBITRON splits certain counties, treating each portion as if it were a separate county.) Each county (or portion), is allocated exclusively to a single ADI; thus overlap is eliminated. All of the area of the United States is covered except for Hawaii and Alaska.
